

COMBINATION SHIPPING/DISPLAY CONTAINER

Abstract

A container comprises first and second ends, the first end being closable in conventional manner by flaps, and the second end having a display panel that partially defines a display opening. A closure panel is movable between a closed position where it covers the display opening for shipping the container, and an open position where the display opening and display panel are exposed to display contents of the container. The display panel includes side panels and a securing panel interlocked with the side panels.
